Alaska Region Sustainable Fisheries

Guided Angler Fish Program 2025 Annual Report

Prepared by the Alaska Region Sustainable Fisheries Division
November 26, 2025

The Guided Angler Fish (GAF) Program authorizes limited annual transfers of commercial halibut individual fishing quota (IFQ) as GAF to qualified charter halibut permit (CHP) holders for harvest by charter vessel anglers. When charter management measures place size or harvest restrictions on charter anglers, qualified CHP holders may offer GAF to charter anglers as a means for the angler to retain halibut of any size and up to the limits allowed for unguided anglers. National Marine Fisheries Service (NMFS) implemented the GAF Program in 2014 as part of the Catch Sharing Plan for International Pacific Halibut Commission (IPHC) Regulatory Areas 2C (Southeast Alaska) and 3A (Southcentral Alaska) (78 FR 75844, December 12, 2013).

This report summarizes the most recent year of GAF activity and provides historical details on the GAF Program since its inception. Among the information presented are the conversion factors that will be used to calculate IFQ to GAF for the 2025 fishing season. Regulations for the GAF Program are found at 50 CFR 300.65(c)(5).

The use of GAF allows charter vessel anglers in Areas 2C and 3A to harvest up to two halibut of any size per day, and fish on days otherwise closed to halibut retention by guided anglers. Otherwise, in 2025, charter vessel anglers in Area 2C were limited to one halibut per day that was 37 inches or less or 80 inches or greater in total length. Additionally, halibut could not be retained on charter vessels in Area 2C on Tuesdays from May 13 to September 9. Furthermore, CHPs and charter vessels could only be used for 1 charter vessel fishing trip per day. In Area 3A, charter vessel anglers were allowed to keep two halibut per day; however, if two fish were kept, one had to be no more than 27 inches in total length. Charter vessels in Area 3A were also limited to one trip per day, and halibut could not be retained on all Tuesdays and Wednesdays throughout the year (90 FR 13293, March 21, 2025).

NMFS issues GAF in numbers of halibut, based on a conversion factor from the average weight of GAF harvested in the respective area in the previous year. For this report, halibut weights were calculated from measured lengths using the most recently revised length-weight relationships published by the IPHC in 2023. The conversion factors for GAF leases in 2025 were 59 pounds (lb) of IFQ per GAF in Area 2C and 16 lb of IFQ per GAF in Area 3A (Table 1). For 2026, the conversion factors will be 57 lb of IFQ per GAF in Area 2C and 18 lb of IFQ per GAF in Area 3A (Table 1).

In 2025, NMFS processed IFQ to GAF transfers totaling 329,426 lb of IFQ to 172 unique CHP holders. These transfers authorized the potential harvest of up to 8,533 additional halibut as GAF by charter vessel anglers. Table 2 indicates the pounds of transferred IFQ has generally increased each year from 2014 through 2019, then decreases substantially in the atypical 2020 season. Through 2025, the total pounds of IFQ transferred to GAF has continued to increase. Note the number of fish that could be harvested has varied from year-to-year, depending upon the conversion factors mentioned above.

Approximately 3 percent of the GAF permits transferred in 2025 were “self-transfers”; that is, the same person held both the IFQ and the CHP, and they transferred the IFQ to themselves (Table 2). The percentage of self-transfers has been consistently higher in Area 3A than 2C: over the 2014 to 2025 period in Area 3A, self-transfers ranged from 11 to 67 percent of the total, whereas, in Area 2C, only 2 to 14 percent have been self-transfers.

If GAF transfers involve a monetary transaction (as opposed to self-transfers, or gifts of GAF) then GAF participants are required to report the value of the transaction. Of the transfers for which price information was reported, and excluding prices associated with self-transfers, lease prices in 2025 averaged \$5.43/lb in Area 2C and \$3.91/lb in Area 3A (weighted averages). For both areas combined, the overall weighted average price per pound of IFQ leased as GAF in 2025 was \$5.14, which is somewhat less than the previous four years (Table 2).

The actual number of pounds harvested annually as GAF is calculated by summing the weights for individual fish, which are determined from the IPHC halibut length-weight conversion table. Table 3 summarizes the estimated pounds of halibut harvested as GAF for each year since the program was implemented. Charter vessel anglers harvested 6,579 fish as GAF from the combined IPHC areas in 2025, which represented 77 percent of the total GAF fish potentially available for harvest.

Unused GAF are returned to the commercial IFQ holders, either voluntarily in August and September or automatically 15 days before the end of the commercial halibut season. NMFS processed 20 voluntary returns of GAF to IFQ totaling 4,888 lbs through mid-September. Automatic returns of GAF to the original IFQ account occurred on November 24, with 47,567 total IFQ lb returned through 279 individual, automatic transfers: 26,255 lb in Area 2C and 21,312 lb in Area 3A.

Guides are required to electronically report the length of each GAF harvested. The average length of GAF harvested in 2025 was approximately 53 inches in Area 2C and 36 inches in Area 3A (Table 3). Since the beginning of the program, the size of GAF in Area 3A has consistently been smaller than Area 2C. Tables 4 and 5 provide the frequency distribution of the lengths of GAF harvested over the 2014 to 2025 period. In all years, the majority of GAF in Area 2C was between 40 and 64 inches, whereas, in Area 3A, the lengths of GAF were smaller and more widely distributed, with the majority of fish taken in the categories of 25 to 44 inches.

Because GAF is a use of IFQ, NMFS' costs associated with management, data collection, and enforcement of the GAF Program are recoverable through IFQ Program cost recovery fees. NMFS does not track fees associated with GAF separately from other IFQ Program fees.

Table 1. IFQ to GAF conversion factors

Year	Conversion Factor (IFQ lb / GAF)	
	Area 2C	Area 3A
2014	26.4	12.8
2015	67.3	38.4
2016	65.1	36.1
2017	74	42
2018	71	44
2019	66	42
2020	61	40
2021	72	57
2022	74	27
2023	65	23
2024	61	23
2025	59	16
2026	57	18

Note: Starting in 2017, the conversion factor is rounded to the nearest whole number to more accurately reflect regulatory requirements of 50 CFR 300.65(c)(5)(E).

Table 2. Summary of IFQ to GAF transfers

Year	IPHC Regulatory Area	IFQ Pounds Transferred	Number of GAF Transferred	Number of GAF Permits Issued	Number of GAF Permit Holders	Weighted Avg. price per pound	Percentage of self-transfers
2014	2C	29,498	1,117	92	30	\$ 5.62	14%
